***RECURSIVE
GRAPHICS***

★ *INTRODUCTION* ★

Recursive graphics use simple shapes drawn repeatedly to form complex images. We implemented Sierpinski triangle, Koch Snowflake, and the Hilbert Curve using Python Turtle to visualize and C++ to implement the recursive algorithms.

FRACTALS

- Fractals are infinitely complex patterns that repeat a simple process over and over in an ongoing feedback loop, driven by recursion.
- Fractal patterns are prevalent in nature, appearing in various forms such as trees, rivers, and mountains. They can also be generated by computers through simple equations.

L-SYSTEM INSTRUCTIONS

F	Draw a line and move forward
+	Turn right
-	Turn left

- These instructions are used by the Python turtle in order to draw each graphic

AN EXAMPLE OF L-SYSTEMS

```
F + F - F - F + F + F F - F + F - F - F + F - F F + F + F - F - F + F + F F F F - F + F

```

- This is the first 60 characters of the l-systems.txt file used to command the python turtle in order to draw a Sierpinski Triangle

03

***SIERPINSKI
TRIANGLE***

SIERPINSKI TRIANGLE

- Named after the Polish mathematician Waclaw Sierpiński
- Constructed by recursively dividing an equilateral triangle into smaller equilateral triangles and removing the central triangle at each iteration.
- The result is a self-replicating pattern with intricate triangular voids.

**KØCH
SNØWFLAKE**

KÖCH SNOWFLAKE

- Created by Niels Fabian Helge von Koch; one of the first fractals to be described
- Shape begins as an equilateral triangle and gets more complex as smaller equilateral triangles are added to the edges
- Made up of three Koch Curves.

★ **HILBERT CURVE** ★

HILBERT'S CURVE

- Originally proposed by David Hilbert in 1891
- Constructed using a recursive algorithm, where the curve at each level is built by connecting straight lines and making 90-degree turns.
- Known for its space-filling properties, and the code effectively generates a curve that covers a 2x2 square, filling it progressively with each level of recursion.
- Way to determine the size of $m \times m$ matrix is $m = 2^n$, where n is the number of levels
- The angle parameter plays a crucial role in shaping the curve, and the code manages these parameters to ensure proper turns and connections.
 - Takes in both positive and negative angles
